

Data Validation

Write a Java main program segment that uses a do-while loop to ask the user what they would like to drink, "coffee" or "tea". If they answer with anything other than "coffee" or "tea", print an error message and ask them again.

The user should be able to enter any combination of lower case and upper case letters. For example, "Coffee", "TEA", "TeA", etc.

Then depending on what they enter, display the line, "Your coffee is ready" or "Your tea is ready".
